1 Methods 1.1 Generalised Bernoulli social equation We model the density of interaction ties  $\rho(r, t)$  in an  $n$ -dimensional social phase space. Inspired by incompressible fluid flow, we propose the continuity-like equation  $\partial \rho / \partial t + \nabla \cdot (\rho \mathbf{v}) = 0$ , (1) with velocity field  $\mathbf{v} = -\alpha \nabla \Phi + \beta \mathbf{r}$ , (2) where  $\Phi = \ln \rho$  is a potential akin to information pressure,  $\alpha > 0$  modulates entropic attraction, and  $\beta > 0$  encodes centrifugal social cost. Combining both gives the \*\*generalised Bernoulli equation\*\*  $\partial \Phi / \partial t + \alpha \nabla^2 \Phi + \beta \mathbf{r} \cdot \nabla \Phi = 0$ . (3) 1.2 Fractal dimension estimators At steady state ( $\partial \rho / \partial t = 0$ ), the density  $\rho$  admits a scaling form  $\rho(r) \propto r^{-(D+1)}$  for  $r$  in the mesoscopic range. We estimate the capacity ( $D_1$ ), information ( $D_2$ ) and correlation ( $D_3$ ) dimensions via a standard box-counting scheme[?].  $D_q = \lim_{\epsilon \rightarrow 0} \frac{1}{q-1} \log \frac{\sum_i P_i^q}{\sum_i P_i}$ , ( $q \in \mathbb{R}$ ). (4) 1.3 Entropy-based stability criterion Table 1: Symbols and units used throughout the manuscript

Symbol	Meaning	Unit (SI)
$\rho(r, t)$	Social tie density	$\text{m}^{-n}$
$\mathbf{v}$	Social flow velocity	$\text{m s}^{-1}$
$\Phi$	Informational potential	$\ln \rho$
$\alpha$	Entropic attraction coefficient	$\text{m}^2 \text{s}^{-1}$
$\beta$	Radial cost coefficient	$\text{s}^{-1}$
$D_1, D_2, D_3$	Fractal dimensions	—
$H$	Shannon entropy	$\text{nat}$

$\partial \rho / \partial t + \nabla \cdot (\rho \mathbf{v}) = 0$ , (5)  $\mathbf{v} = -\alpha \nabla \Phi + \beta \mathbf{r}$ , (6) Define the Shannon entropy of degree distribution  $p_k$  as  $H = -\sum_k p_k \log p_k$ . We posit global stability when  $dH/dt = 0$  and  $d^2 H/dt^2 < 0$ . (7) Substituting Eq. (??) yields the critical ratio
